

FAQ - Oncologist

Q. 150mg dose in one dose is too much. Will it be harmful to the patient?

A. Maximum recommended total dose of doxorubicin per procedure is 150mg. PRECISION I included a dose escalation study up to 150mg doxorubicin and the 150mg dose was safe and effective. There were no dose-related adverse events. The tumour response rate at 6 months was 87% at this dose.

In Precision V, Biocompatibles' phase III randomised controlled clinical trial, the dose is 150mg.
